

A software solution designed to automate repetitive compliance documentation processes. Configuration management, requirements management, electronic test execution, corrective and preventive actions are integrated under a single platform.

Manage information across physically separate related documents

Benefits

- Keep all documents “synced” and up-to-date
- Eliminate manual paperwork and speed up documentation
- Ensure data and processes are connected
- Automatically generate and link test documents
- Real time status across all documents
- Lower costs and allow for “Proactive Compliance Management”

QValid™ presents a different approach than common documentation solutions. It includes usual electronic features that accelerate documentation (i.e workflows) and maintain compliance (audit trails, electronic signatures), but supports special features that genuinely automate and improve the most tedious processes.

Traceability is possible across all documents, supporting risk based methods, showing all related documents that need to change when one modification is made. The traceability matrix can be automatically generated, justifying documentation efforts.

Electronic validation can be accelerated by automatically creating and linking test scripts from requirements.

Deviation reports are automatically generated and linked to the tests enforcing compliance. All approved documents versions remain stored in QValid™ and all changes are made through a change control workflow.

Users can create, edit and manage documents in Microsoft Word or through the Web interface. Projects can be managed from any location and are saved in a centralized repository.
